FUEL POLISHING

You depend on your generator to power your operation at the most critical times. Don't let poor fuel quality create failure that jeopardizes your facility. Even the smallest amount of contaminants can cause:

- Loss of power
- Incomplete combustion
- Excessive emissions
- Injector failure

Even if tested weekly for a minimum of 30 minutes as recommended, an Emergency Power System (EPS) rarely shows any signs of problems. It's when the EPS is required to run for an extended period of time, like in an emergency situation, that failures can occur.

During this scenario, all of the contents within the tank will be suspended in the fuel. If the filters on the diesel engines are overwhelmed by contaminants suspended in the fuel, then the EPS will fail due to clogged filters.

Maintaining a fresh supply of fuel for an EPS is not as difficult as it once was. It is now possible to filter fuel and clean the tank simultaneously, rather than emptying the tank completely and disposing of contaminated fuel with on-site fuel polishing.

Fuel polishing is the process of reversing corrosion. It removes water, sludge, dirt and other contaminants from your fuel that have built up in your tank over time. The NFPA recommends that steps be taken to maintain the integrity of your fuel (NFPA Standard 110). Taking advantage of fuel polishing services from Cleveland Brothers will ensure that your fuel is clean, dry and free from water and dirt to keep your engine and fuel in optimal condition.

Trust our experts to diagnose your fuel, then clean, dry and restore it to clear and bright condition without even entering your tank.

Cleveland Brothers uses a Mobile Fuel Polishing System to efficiently and safely clean and restore your fuel to pristine condition. This system is designed for tanks with contaminated fuel that require the removal of:

- Water
- Sediment
- Sludge Accumulation

Contact your local Cleveland Brothers location for more information on fuel polishing.
